Enthiran Jump – AI Powered Custom Doodle Jump Game

Step 1: Topic Based on My Interest

I selected Cinema + Gaming + AI Coding as my favorite topic.

I am a huge fan of the Tamil movie Enthiran (Robot) starring Rajinikanth. Instead of creating a normal game project, I wanted to build something unique by combining:

Doodle Jump game mechanics

Enthiran movie theme

Rajinikanth robot character

Custom background music

AI-assisted coding

This made the project exciting and helped me stay motivated throughout development.

My Initial Prompt

Create a Doodle Jump style game using HTML, CSS and JavaScript.

I want a custom game where the character jumps on platforms continuously.

Add left and right movement controls.

Include score tracking and game over functionality.

Problems I Faced

While building the game, I faced multiple technical issues:

1. Image Loading Error

My character images were not loading correctly because I pasted normal image page URLs instead of direct image links.

Problem:

JavaScript

`https://ibb.co/xxxx`

Correct format:

JavaScript

`https://i.ibb.co/xxxx/image.png`

2. Canvas Rendering Error

The game showed:

InvalidStateError: CanvasRenderingContext2D.drawImage

This happened because broken image links caused the canvas to fail.

3. Background Image Issues

Initially, my game poster and gameplay background were not displaying properly due to incorrect URL formatting.

4. Audio Autoplay Issue

Menu background music was not playing because browsers blocked autoplay audio. I fixed this by triggering menu music after user interaction.

How I Used AI to Fix It

I continuously used AI to:

Debug image issues

Fix JavaScript errors

Improve game design

Add menu screen

Add custom background music

Improve gameplay experience

Every time something broke, I updated my prompt and asked AI to improve the code.

Updated Prompt

Create a custom Doodle Jump game inspired by the movie Enthiran.

Add:

Custom movie poster menu screen

Start game button

High score button

Left and right robot character movement

Score tracking system

Game over screen

Technologies Used

HTML
CSS
JavaScript
PlayCode
AI Assistance
Image Hosting Tools
Audio Hosting Tools

Final Output

I successfully created Enthiran Jump, a custom movie-themed jumping game where:

- ✓ Custom poster appears on home screen
- ✓ Menu music plays
- ✓ Start Game button launches gameplay
- ✓ Robot jumps across platforms
- ✓ Left/right controls work
- ✓ Gameplay music plays
- ✓ Score system works
- ✓ High score gets saved

What I Learned

Through this project, I learned:
AI can accelerate coding development
Debugging is an important skill
Prompt engineering matters

Small mistakes like wrong URLs can break entire projects
Creativity makes coding more fun

Project Screenshots

Home screen screenshot

Gameplay screenshot

Code screenshot

important code snippets only:

Example 1: Character movement logic

JavaScript

```
if (e.key === "ArrowLeft") {
    player.direction = "left";
}
```

```
if (e.key === "ArrowRight") {
    player.direction = "right";
}
```

Example 2: Score system

JavaScript

```
ctx.fillStyle = "white";
ctx.font = "24px Arial";
ctx.fillText("Score: " + score, 20, 40);
```

Example 3: Background music logic

JavaScript

```
menuMusic.play();
bgm.play();
```

Example 4: Platform creation

JavaScript

```
function createPlatforms() {
```

```

platforms.push({
  x: Math.random() * 300,
  y: i * 100
});
}

```

Conclusion

This project showed me how AI can help transform creative ideas into working software products. Instead of building a basic project, I created something based on my personal interests, which made learning coding much more enjoyable.

Project Name: Enthiran Jump

"A custom AI-assisted cinematic jumping game inspired by Enthiran."
